20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This report extends and revises Technical Report 83-1 which presents and describes the <u>Historical Inflation Program</u> , a computer program generating historical inflation indices for Army aircraft. The program can be updated monthly, is easily revised for changes in Bureau of Labor Statistics methods, and is capable of handling data for all fiscal year formats. Output is expressed as monthly, quarterly, fiscal year, and calendar year inflation indices (in calendar year 1967 base) and inflation factors (in fiscal year base). This report contains updated tables of inflation factors, expressed in the FY 83 base.	ALL

20. ABSTRACT.

These indices and factors provide a means of adjusting historical cost data for the procurement of Army aircraft to constant year dollars. Additional features include: computations for the derivation of revised weighting factors, detailed indices enabling the adjustment of historical labor and material costs separately, a discussion of aggregate weighting factors for labor and materials (including trends from sensitivity analysis with more background materials), and additional documentation aimed at making the report useful to a large cross section of the DOD rotary wing aircraft community. This report has been revised to include the latest information concerning the UH-60A BLACK HAWK. This system has been integrated into the Historical Inflation Program for Army aircraft.

ACKNOWLEDGEMENTS

The authors extend their appreciation to Mr. Conrad Weglers of the Kansas City Regional Office of the Bureau of Labor Statistics, U.S. Department of Labor, for special assistance with wage and price data.

Credit is due Mr. John M. Barnett and Mr. H. Kevin Wille for supplying research material and data from their paper entitled UH-60A BLACK HAWK Aircraft System
eculiar Historical Inflation Indices.

Appreciation is extended to Mr. Bruce Powell, USATSARCOM DMIS, who provided the programming assistance required to introduce the UH-60A hi-technology aircraft into the Historical Inflation Program.

Mrs. Marva Campbell provided excellent clerical support in the revision of this paper.

DISCLAIMER STATEMENT

The views, opinions, and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy, or decision unless so designated by other documentation.

I. APPLICABILITY. The inflation indices and factors published in this report are applicable to the adjustment of historical costs for the procurement of Army aircraft. These costs are currently funded by the Aircraft Procurement, Army and Other Procurement, Army appropriations.

II. AN OVERVIEW OF THE HISTORICAL INFLATION PROGRAM

A. History

The Historical Inflation Program for Army aircraft procurement was developed using a series of documents, the first being Aerospace Price Indices, by H.G. Campbell, (December 1970). This document established a basis for the construction of general aircraft indices, identified items of special interest and concern, and demonstrated the importance of thorough analysis of material composition when constructing an historical index. Between 1973 and 1976, the United States Army Aviation Systems Command (USAAVSCOM) developed several indices for rotary wing aircraft, and from 1977 to 1983 this function was performed by the Components and Operational Studies Branch, Cost Analysis Division, Office of the Comptroller, USATSARCOM. At present the indices are being produced by the Validation/Program Branch, Cost Analysis Division, Office of the Comptroller, USATROSCOM, by transition agreement. The current indices are based on research done in the period 1972 to date. In July 1973, the Office of the Comptroller, Cost Analysis Division, made a study of materials used in the Army helicopter systems then, or most recently, in production. Cost Information Reports were assembled, and contractors were asked to supply lists of materials for both airframe and engine, on the basis of contribution to weight. Contractor technical and engineering personnel provided assistance with data interpretation and definitions for items whose composition was unclear from engineering documents and Detailed Weight Statements. In January 1983, a special research study entitled UH-60A BLACK HAWK Aircraft System Peculiar Inflation

Indices was written by H. Kevin Wille and John M. Barnett (ref 9) and data from this study has been included in this report.

The following aircraft have been selected:

UH-1	OH-6	AH-1	UH-60A
CH-47	OH-58	CH-54	

This selection of aircraft is deemed typical for several reasons. First, the seven helicopter systems listed above make up over 90% of the U.S. Army's current helicopter fleet. Second, a number of these aircraft have been produced on a long term continuous basis in numerous models. Third, they are among the systems most likely to be used in developing Cost Estimating Relationships for new systems by use of parametric techniques. Fourth, they include the new high technology UH-60A BLACK HAWK aircraft.

The September 1973 historical inflation cost research report, cited in the references, was the first report to make use of this research. It was updated by the August 1974 historical cost research report, and then by a series of expanded analyses under current title, Historical Inflation Program, since that time. A list of the assumptions and changes in methodology over the period referenced are included in the technical section of this report.

B. Construction of Indices - Methodology.

The indices are developed by a stepwise, building process, which computes the contributions to cost on a weighted, value-added basis.

1. First, the contribution to cost of small parts and other purchased equipment is calculated.
2. Next, the contribution to cost of purchased equipment is combined with that of raw materials to get the cost of purchased materials.
3. Cost of purchased materials is then combined with contractor labor cost to compute the index for components such as engine or airframe.

4. The indices for engine, airframe, and avionics are combined to get indices for aggregate aircraft.

C. Indexing Techniques.

The procedure used is "cost-weighting". The information obtained from the 1973 research entitled Material Composition of U.S. Army Helicopters established percentages based on weight. Because the indices used to track material costs are based on monetary considerations (e.g., Producer Price Index; Wages, by Standard Industrial Code), percentages by weight had to be transformed into percentage contributions to cost, if PPI and SIC inflation factors were to be applied directly. Based on the premise of profit maximization, contractors should tend to minimize the use of expensive materials subject to maintaining acceptable performance standards; essentially, materials with a high cost per unit weight ratio would be used sparingly. Adjusting a percentage based on weight using a monetary index would not only result in an improper index initially, but also one with diminishing reliability. The latter bias is avoided by calculating

the contribution to cost, instead of merely the contribution to weight.

D. Weighting Factors. Although the model is developed by an iterative, stepwise process, the revised weighting factors in the table at the end of Appendix B implicitly include all calculations. The index, as stated, is merely the direct sum of the products of the weights and their corresponding material index values. The development of weighting factors is illustrated in the Technical Section.

E. Data. The data used in the program are inputted in two different forms. Yearly data are presented by calendar year 1947 to date, and monthly data are presented for 1967 to date. The yearly data, pre 1958, are condensed into three columns; the data for 1958 and later are presented in an 18 column format (14 columns for material and 4 for labor). The data, their characterization, and any redefinition by the Bureau of Labor Statistics over the years, are tracked in line diagram C-2.

F. Validity and Firmness of Data.

The Producer Price Index and hourly wage data were supplied by the Kansas City Regional Office of the Bureau of Labor Statistics, U.S. Department of Labor. The data comes in three published formats: (1) a cumulative history covering past years on a monthly basis,

(2) yearly supplements (such as wage and price index annual supplements) which list the previous twelve months, and (3) monthly publications which list the most current month and several other months for comparison.

For data to be "firm" it must be at least 18 months old because it is benchmarked and adjusted after the fact. Only small samples are taken throughout the year. However, during one month, the benchmark month, a much more comprehensive sample is taken. Due to its significantly larger sample size, the benchmark month sample is felt to be more representative than those of other individual months. If the benchmark value diverges significantly from the pattern, the other months are adjusted proportionately to conform to its base as benchmark.

The data in a cumulative history publication is felt to be firm or "final". Basically, such publications provide a chronological listing of all firm data available for the past history of those indices. However, the data in these publications is usually 18 to 24 months behind the current period. The data for each month listed in the annual supplements is not necessarily firm because benchmarks occur during the calendar year, and at different times for different series. Adjustments may not have been made before the annual supplements are published. The data in the monthly publications are even less firm. In general, the Producer Price Index data are firm before the wage indices for the corresponding month, due to the fact that it is easier to define and measure price changes for commodities than for human skills.

G. Respecification of the Data Set

From time to time, the Bureau of Labor Statistics redefines labor and material codes to meet the changing needs of its clientele and to cope with a variety of sampling problems. Due to respecification or deletion of PPI codes by BLS the data set used in the Historical Inflation Program must change. The changes since the last report are as follows:

<u>OLD CODE AND TITLE</u>	<u>NEW CODE AND TITLE</u>
10130264 Sheets, C.R. Stainless	10170755 Sheets, C.R. Stainless

The reclassification had little or no impact on this study due to the essential similarities, by definition, of the old and new material categories. The historical flow of the labor and material data from 1947 to date is illustrated by chart C-2, in appendix C.

H. Introduction of the UH-60A BLACK HAWK Aircraft

In October 1978, the first UH-60A Black Hawk helicopter was delivered to the U.S. Army. With development of the Black Hawk, an era of high technology was introduced into the construction of Army aircraft. The airframe and T700 engine of the Black Hawk embody significant technological improvements as compared with previous Army aircraft. Beginning in 1980, preparations to include the UH-60A Black Hawk in the Historical Inflation Program for Army aircraft were begun.

The addition of Black Hawk to the Historical Inflation Program required a reevaluation of the Army's average helicopter. With

the inclusion of the Black Hawk, it was evident that the weights accorded hi-tech materials such as titanium and monel metal would increase. However in 1980 it was not known how Black Hawk would affect the average bill of materials in the Historical Inflation Program or the indices themselves.

The first attempt to study the content of Black Hawk within the perspective of historical inflation was by H. Kevin Wille and John M. Barnett in their paper UH-60A Black Hawk Aircraft System Peculiar Historical Inflation Indices (reference 9). The same material data and resources used to construct their system peculiar indices were used to revise the Historical Inflation Program. The most important conclusion reached concerning the calculation of inflation indices in the revised aircraft paper was that the fourteen material and four labor categories previously established could be retained.

The second conclusion, of course, was that the relative weights of the combined bill of materials had changed and that the contributions to cost of each cost component would have to be recalculated. This was done using ratio and proportion techniques on the original analysis to establish the revised, hi-tech index equations.

The indices exhibit significant change, especially in the engine index. In addition to the current FY 83 index, the hi-tech index is also now used for FY 80 thru FY 82. The reasons for this are two. First, between 1978 and 1980 the pipeline for Black Hawk was filled. Second, according to AVSCOM project managers, in 1980, Black Hawk procurement was more than 50% of the

Army's rotary wing aircraft procurement.

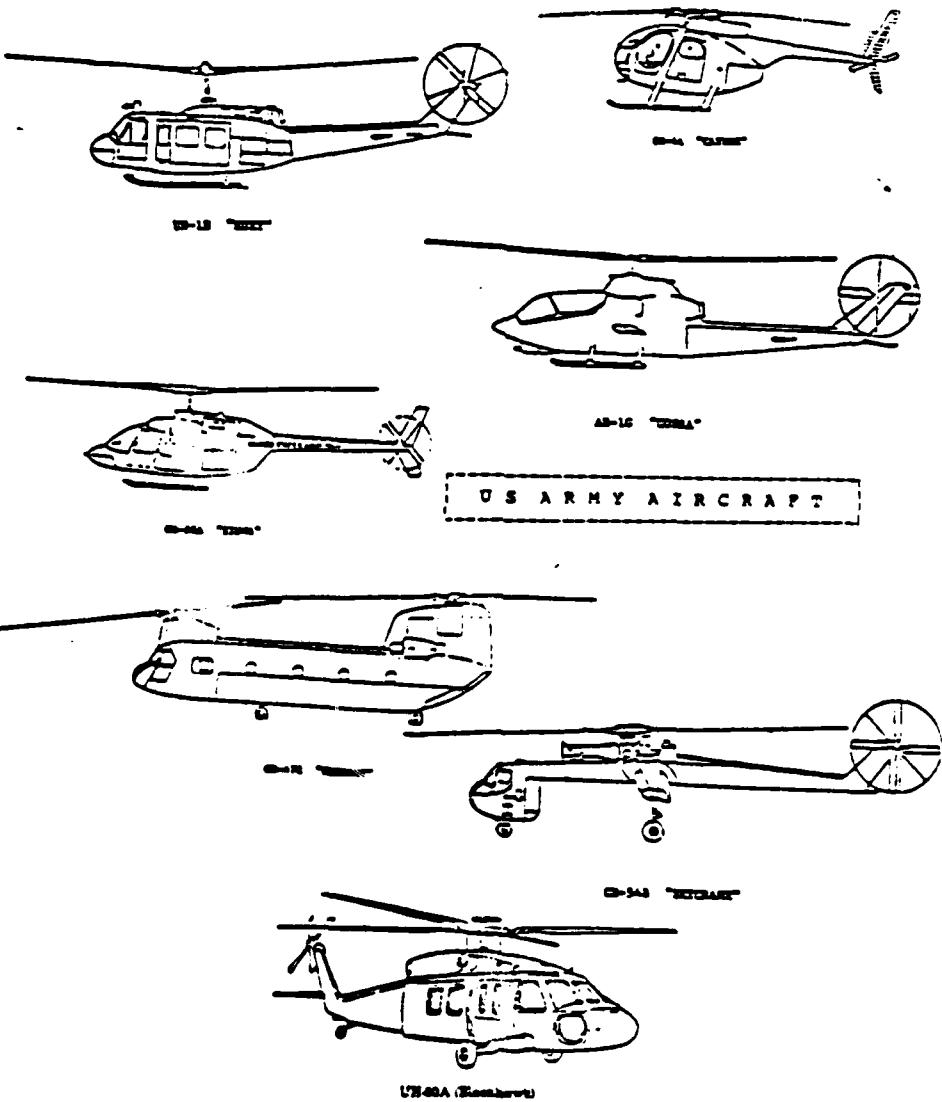

I. Additional Publications Relating to this Report

The Comptroller, Cost Analysis Division, can supply the following publications which may be of assistance in using and interpreting these inflation indices:

- CM 82-2 Inflation Indices, An Introduction to Basic Theory and Their Application with sample problems. November 1981.
- CM 84-6 The Historical Inflation Program, for Army Aircraft Abbrev Ed., January 1984.
- CM 84-5 The Troop Support Inflation Program, December 1983.

USA AVSCOM 1973 COST DATA

AMSAW-CCE

31 July 1973

MEMORANDUM TO: Mr. Gerald Dockins, Acting Chief, Estimates and Studies Branch

FOR: Mr. Edward P. Leughlin, Chief, Cost Analysis Division *SJ*

SUBJECT: Material Compositions Analysis of U.S. Army Helicopters. July 1973

1. On 6 June 1973, this office received a request from Mr. W.J. Tropf, ASAC Comptroller Office, Cost Analysis Division, for the material composition of a UH-1H helicopter. On 18 June 1973, Chief, AVSCOM Comptroller Office, Cost Analysis Division requested a similar analysis be performed on the following Army helicopters:

a. CH-47C.

b. OH-6A.

c. OH-58A.

d. AH-1G.

e. CH-54B.

2. A search of the technical data files and aircraft drawings failed to produce the desired data. The analysis was completed with the assistance of AVSCOM Systems Engineering Division, Directorate of R&E and pertinent U.S. Army Plant Activities. Contractors were also contacted during the data search, and others. The data obtained are a combination of expert opinion, engineering estimates and contractor data obtained under previous contracts.

3. The following Cost Analysis personnel were assigned to this project:

NOTES:

- (1) Airframe factors were obtained from a sample of 5 CIR reports and other documents representing the AH-1, CH-47, CH-54, OH-6, OH-58, and UH60A aircraft systems.
- (2) Engine factors were obtained from a sample of 14 CIR reports and other documents representing 12 different turbine engine configurations procured from Lycoming, Allison, General Electric, and Pratt & Whitney.

1. From HISTORICAL INFLATION INDICES FOR ARMY AIRCRAFT
US Army Aviation Systems Command, St. Louis, 1974, p. 11.

TECHNICAL SECTION

IV. ANALYSIS: (TECHNICAL SECTION).

A. Chronology. Previous efforts related to the development of inflation indices include Aerospace Price Indexes by H.G. Campbell, RAND Corporation, December 1970 (Reference 1) and two cost research reports: Historical Inflation Indices for Army Aircraft, Cost Analysis Division, Office of the Comptroller, U.S. Army Aviation Systems Command, September 1973 (Reference 4), and Historical Inflation Indices for Army Aircraft, Cost Analysis Division, Office of the Comptroller, U.S. Army Aviation Systems Command, August 1974 (Reference 5).

1. Characteristics of the RAND Report.

a. Specific Producer Prices and Price Indexes (Reference 8) and Employment and Earnings (Reference 2) data have been selected as proxy series for similar commodity and labor categories experienced in the procurement of Army aircraft. Aircraft inflation indices are constructed from a weighted average of these proxy series. The weighting factors for this average are derived from estimates of the relative contribution to the total aircraft cost made by each component (commodity or industry labor group) comprising the index. The index is thus a "cost-weighted" series.

b. A 2½ percent compounded annual rate for growth of overhead ratios is assumed.

c. No adjustment is made for productivity increases.

d. Indices are developed on a calendar year basis.

2. Characteristics of the September 1973 Cost Research Report.

a. As with the RAND report, aircraft inflation indices have been constructed from a weighted average of Producer Prices and Price Indexes and Employment and Earnings data selected as proxy series for their similarity to those commodities and labor categories experienced in the procurement of Army aircraft. Weighting factors are proportional to the relative physical weights or masses, rather than to the relative costs of commodities comprising the "composite material" portion of the index as in the RAND report. Thus, the "composite material" portion of the index represents a "weight-weighted" series.

b. Like the RAND report, a 2½ percent annual growth in the overhead ratio is assumed.

c. No adjustment is made for productivity increases.
d. Indices are developed on a calendar year basis.
e. For years for which certain specified Producer Price Indexes were unavailable, data has been projected from adjacent years.

3. Characteristics of the August 1974 Research Report.

a. As before, Producer Prices and Price Indexes and Employment and Earnings data have been selected as proxy series most similar to those commodities and labor categories experienced in the procurement of Army aircraft. The indices have been constructed from a weighted average of these proxy series utilizing the weighting factors used in the September 1973 Cost Research Report. The "composite material" portion of the index represents a "weight-weighted" series.

b. Unlike RAND and the September 1973 Cost Research Report, no adjustment for overhead growth is assumed.

c. No adjustment for productivity increases is assumed.

d. Indices have been extended to FY 1974 by assuming that data for the September 1973 Cost Research Report represented December and hence the fiscal year midpoint, rather than the annual average, of each calendar year.

e. For years for which certain specified Producer Price Indexes were unavailable, data has been projected from adjacent years.

B. Data Sources. Data sources for this report are Producer Prices and Price Indexes (reference 8) and Employment and Earnings (reference 2). To insure that the latest revisions were incorporated into the data base, data was obtained from the Kansas City Regional Office, Bureau of Labor Statistics, and annual supplements to Producer Prices and Price Indexes. For Employment and Earnings, data for any given month was obtained from the latest available source. Data used in this report are displayed in Appendices D, E, G, and H.

C. Methodology.

1. Overhead and Productivity Adjustments. On the basis of data covering a ten year period, the RAND report concluded that there exists a secular growth trend of 2½ percent per year in the production overhead rate. The report also concluded that there has been little, if any, improvement in productivity to counteract the observed trend in overhead growth. This conclusion appears to

be unwarranted, particularly in light of productivity gains recorded (as measured by Industrial Production Indices) for similar sectors of industry. Thus, in order not to unduly bias the results of the analysis, this report makes no adjustment for either overhead growth or improvements in productivity.

2. Calculation of Weighting Factors. From a number of Cost Information Reports, the following weighting factors were developed and reported in the September 1973 Cost Research Report.

For the Airframe:

Purchased Equipment = (.378) Raw Material + (.622) Labor 3728
Total Material = (.582) Purchased Equipment + (.418) Raw Material
Total Airframe = (.378) Total Material + (.622) Labor 3721

For the Engine:

Purchased Equipment = (.599) Raw Material + (.401) Labor 3728
Total Material = (.295) Purchased Equipment + (.705) Raw Material
Total Engines = (.599) Total Material + (.401) Labor 3724

And for Avionics:

Total Avionics = (.315) Material + (.685) Labor 367X

In the previously published indices, the weighting factors used to develop the material portion of the indices were made proportional to the relative physical weights of the various commodities used in the construction of the aircraft. The material portion of these indices thus represent a "weight-weighted" series. In order to be consistent with the intended

purposes of an inflation index, the methodology in this program uses index weighting factors proportional to the numerical products obtained from multiplying the relative physical commodity weights by the appropriate base year cost per pound. This yields a "cost-weighted" index giving more weight to such expensive commodities as titanium. Unfortunately, however, price per pound data are not published in Producer Prices and Price Indexes for each of the commodities used in constructing the indices. To overcome this difficulty, the per pound price was estimated from the available data of the most closely related commodities. To minimize the effect from related commodities which have relatively little economic impact, each price per pound estimate was developed from a weighted average of available data utilizing the Bureau of Labor Statistics 1975 revised relative weights published in the 1975 Annual Supplement to Producer Prices and Price Indexes. The available data then constitutes a weighted sample from which a surrogate price per pound is computed for the Producer Price Index series in question. See Appendix A for the computations for the derivation of these revised weighting factors, along with their associated cost contribution per pound.

3. Construction of Indices.

a. Calendar Year 1967 was taken as the base for these indices because this year represents the approximate midpoint of the period for which the data supports the development of each of the indices, including those which account for avionics.

Furthermore, 1967 conforms to the base used by the Bureau of Labor Statistics for Producer Price Indexes.

b. Appendix B contains the current Producer Price Index series, Employment and Earnings series, and the associated weighting factors used in the construction of the indices published in this report. Since some of these series have been in existence for only a limited time, other closely related series have been substituted with appropriate mathematical adjustments to insure continuity of the indices. This technique is considered preferable to the synthesis of data by projection from adjacent years. Appendix C depicts the historical flow and identifies the effective dates of series conversions, for the Producer Price Index and the Employment and Earnings data used in the development of the indices published in this report.

c. The term "aggregate" has been selected to indicate inflation indices applicable to the combined Airframe and Engine (aggregate Air Vehicle Excluding Avionics) and to the combined Airframe, Engine, and Avionics (Aggregate Air Vehicle Including Avionics) to avoid confusion with the term "composite" as in "composite escalation indices". Aggregate indices are based upon a standard 70-20-10 weighting (see Reference 6) of the Airframe, Engine and Avionics indices respectively. Aggregate indices are intended for the adjustment of historical cost data for which the distribution of costs for the Airframe, Engine, and Avionics components is unavailable.

d. A section depicting the raw material portion of

the inflation indices is published as Appendix I. It is intended for applications requiring greater accuracy in labor cost escalation. Appropriate labor indices can be obtained from the Bureau of Labor Statistics Employment and Earnings series (Reference 2) as follows:

<u>Labor Category</u>	<u>1967 SIC Code</u>	<u>1972 SIC Code</u>	<u>Industry</u>
Airframe Contractor	3721	3721	Aircraft
Airframe Subcontractor	3723,9	3728	Other aircraft part & equipment
Engine Contractor	3722	3724	Aircraft engines & engine parts
Engine Subcontractor	3723,9	3728	Other aircraft parts & equipment
Avionics	3674,9	367X	Other electronic components
Aggregate Air Vehicle Excluding Avionics	372	372	Aircraft and parts

With appropriate adjustments, labor cost data from specific geographic areas, manufacturers, or plants can be used. The computational formulas for labor cost indexes are given on page B-5 in appendix B.

e. The Basic Computational Methodology is as follows:

(1) For Components: Airframe, Engine, and Avionics.

(a) Calendar year indices are computed using sum of weighted calendar year labor and material indices.

(b) Fiscal year indices are computed in a manner similar to calendar year, but the yearly fiscal averages are generated from the monthly data.

(c) Quarterly indices are computed by averaging three

months data from the monthly data set.

(d) Monthly indices are computed by direct calculation using monthly data. It is a weighted average of monthly figures computed using the same methodology as in computing the calendar year indices.

For additional information, see Appendix B.

(2) Aircraft System Cost

The inflation indices for "Aggregate Vehicle" and "Aggregate Vehicle without Avionics" are produced by combining the three separate indices:

<u>Component</u>	<u>Relative Weight</u>
Airframe Index	70%
Engine Index	20%
Avionics Index	10%
<hr/>	<hr/>
Aggregate Vehicle	100%

<u>Component</u>	<u>Relative Weight w/o Avionics</u>
Airframe Index	78%
Engine Index	22%
<hr/>	<hr/>
Aggregate Vehicle without Avionics	100%

Reduced form equations are displayed in Appendix B, page B-6.

V. DESCRIPTION OF COMPUTER PROGRAM AND ASSOCIATED APPENDICES.

The Historical Inflation Program is a computer program used to generate historical inflation indices for Army aircraft and their major subsystems. Appendices D and G contain the annual data used by the program, while the monthly data, commencing July 1967, are in Appendices E and H. Producer Price Index and Earnings data in these Appendices have been arrayed into columns with the same numerical code sequence used in Appendix B. Historical inflation indices and factors are published in Appendix F. Fiscal Year, quarterly, and monthly indices have been developed from the appropriate monthly data. A section containing the raw material portion only of these indices is published as Appendix I. The labor portion of these indices may be obtained by applying the methodology described on pages B-2 through B-5 to the data contained in appendices D and E.

VI. SENSITIVITY ANALYSIS

Many considerations are important when constructing Historical Indices for tracking purposes. These certainly include the following:

a. The nature of the items chosen to comprise the index.

(1) How typical or representative the items are.

(2) How closely the proxy items approximate the actual items,

if indices for the actual items are not obtainable.

(3) The number of items used, and the detail in the analysis which produced the indices.

b. The determination of the percent contribution to cost - "Cost Drivers".

c. The weighting factors employed in the overall analysis.

A difficult problem confronting cost analysts, who must determine the validity of an historical index for tracking purposes, relates to aggregate labor/material weighting factors. In tracking major weapons systems, the ratio is often stated as say 40/60 - that is 40 percent material and 60 percent labor - as percent contributions to cost. Because it is difficult for analysts to determine the "correct" aggregate mix of labor and material, being external to the project, the aggregate split is certainly of interest.

The value for any index depends on three factors:

1. The number of factors employed, and the quality and depth of the analysis.
2. The values for each component of cost used in the construction of the index.
3. The weights, or levels of importance, given to the factors, individually and collectively.

The objective of this sensitivity analysis is to shed some light on the way in which the aggregate labor/material split affects the index, which has been a controversial issue for some time. Using a set of recursive linear equations, the effect on the historical inflation index, for airframe, resulting from varying the aggregate weighting scheme was calculated, in both raw and percentage terms. The calculations were made using a Wang system 2200 minicomputer, and a sample printout follows. The results provide evidence that the key to a successful index resides in item a. (3) the number of items used, and the quality and detail in the analysis used in preparing the index. Because wages are often tied to the Producer Price Index, or other price indices, in labor agreements, it is not surprising that aggregate weighting percentages for labor and material might not be an extremely sensitive issue. However, the calculations provide strong support

for the position that the identification of cost components and the depth and quality of detail in an analysis are of paramount importance, when developing an index to be used in controlling the cost of a major weapon system.

EXPLANATORY NOTES FOR REVISED WEIGHTING FACTORS

HISTORICAL INFLATION PROGRAM

CONTRIBUTION TO COST	=	CONTRIBUTION TO WEIGHT	X	1967 COST PER POUND	X	NORMALIZATION FACTOR
----------------------------	---	------------------------------	---	---------------------------	---	-------------------------

NOTES: 1. Contributions to cost and weight are percentages in decimal form.

2. Normalization Factor = $\frac{\text{Percent Contribution to Cost of Material}}{\text{Material Cost Per Pound}}$

a. Engine Normalization Factor = $\frac{.5281}{.64986} = .813$

b. Airframe Normalization Factor = $\frac{.2411}{.46167} = .522$

3. Coefficient for Titanium reduced by a factor of .955 in December 1970.
Titanium Sponge Index replaced by Titanium Mill Shape Index.

**COMPUTATIONS FOR THE DERIVATION OF
REVISED WEIGHTING FACTORS
FOR THE HISTORICAL INFLATION PROGRAM**

EXPLANATORY NOTES FOR REVISED WEIGHTING FACTORS

HI-TECH COMPUTATIONS

HI-TECH CONTRIBUTION TO COST	=	PERCENT CONTRIBUTION TO COST	X	HI-TECH ADJUSTMENT FACTOR	X	NORMALIZATION FACTOR
------------------------------------	---	------------------------------------	---	---------------------------------	---	-------------------------

NOTES: 1. Hi-Tech Adjustment Factor = $\frac{\text{New Material Percent by Weight}}{\text{Old Material Percent by Weight}}$

i.e. engine monel sheet is 4.25% by weight under the new bill of materials and 1.32% under the old, so the Adjustment Factor = $\frac{4.25\%}{1.32\%} = 3.22$

2. Normalization Factor = $\frac{\text{Sum of Old Contributions to Cost}}{\text{Sum of New Contributions to Cost}}$

a. Engine Normalization Factor = $\frac{.5281}{.8219} = .6425$

b. Airframe Normalization Factor = $\frac{.2380}{.2794} = .8520$

3. Normalization Factor reduces total material percentages to .2380 (Airframe) and .5281 (Engine) so that when combined with labor percentages of .7620 (Airframe) and .4719 (Engine) cost contributions sum to unity.

i.e. .2380 + .7620 = 1.000 and .5281 + .4719 = 1.000

COMPUTATIONAL FORMULAS FOR LABOR COST INDEXES

The data for cost of labor services is supplied by the Bureau of Labor Statistics, as hourly wage rates by Standard Industry (SIC) Codes, and are reported on a regular basis in Employment and Earnings. Because material indices are expressed as indexes, base 100, and wages are expressed in dollars per hour, labor costs over time must be converted to indices before calculations can be made. The dollar per hour to index conversions for the labor categories are done as follows:

	SIC Code	<u>Industry</u>	CY 1967 Hr. Wage	Current Index
(15)	367X	Electronic Components	Current Hr. Wage	$\frac{\text{Current Hr. Wage}}{\$ 2.34} \times 100\% = 367X$ Index
	375			
(16)	3721	Aircraft Production	Current Hr. Wage	$\frac{\text{Current Hr. Wage}}{\$ 3.49} \times 100\% = 3721$ Index
	3721			
(17)	3724	Aircraft Engines & Engine Parts	Current Hr. Wage	$\frac{\text{Current Hr. Wage}}{\$ 3.42} \times 100\% = 3724$ Index
	3724			
(18)	3728	Aircraft Equipment	Current Hr. Wage	$\frac{\text{Current Hr. Wage}}{\$ 3.35} \times 100\% = 3728$ Index
	3728			

REDUCED FORM EQUATIONS

$$\begin{aligned}\text{Airframe} &= .0211(V-1) + .0021(V-2) + .0057(V-4) + .0007(V-6) + .0062(V-7) \\ &+ .056(V-8) + .0142(V-9) + .0422(V-10) + .0159(V-11) + .0079(V-12) \\ &+ .0660(V-13) + .622(V-16) (100/3.49) + .1369(V-18) (100/3.35)\end{aligned}$$

$$\begin{aligned}\text{Engine} &= .0023(V-1) + .2625(V-3) + .0059(V-5) + .0225(V-7) + .0071(V-8) \\ &+ .0021(V-9) + .0051(V-10) + .0025(V-11) + .1364(V-12) + .0817(V-13) \\ &+ .401(V-17) (100/3.42) + .0709(V-18) (100/3.35)\end{aligned}$$

$$\text{Avionics} = .3150(V-14) + .6850(V-15) (100/2.34)$$

HI-TECH REDUCED FORM EQUATIONS

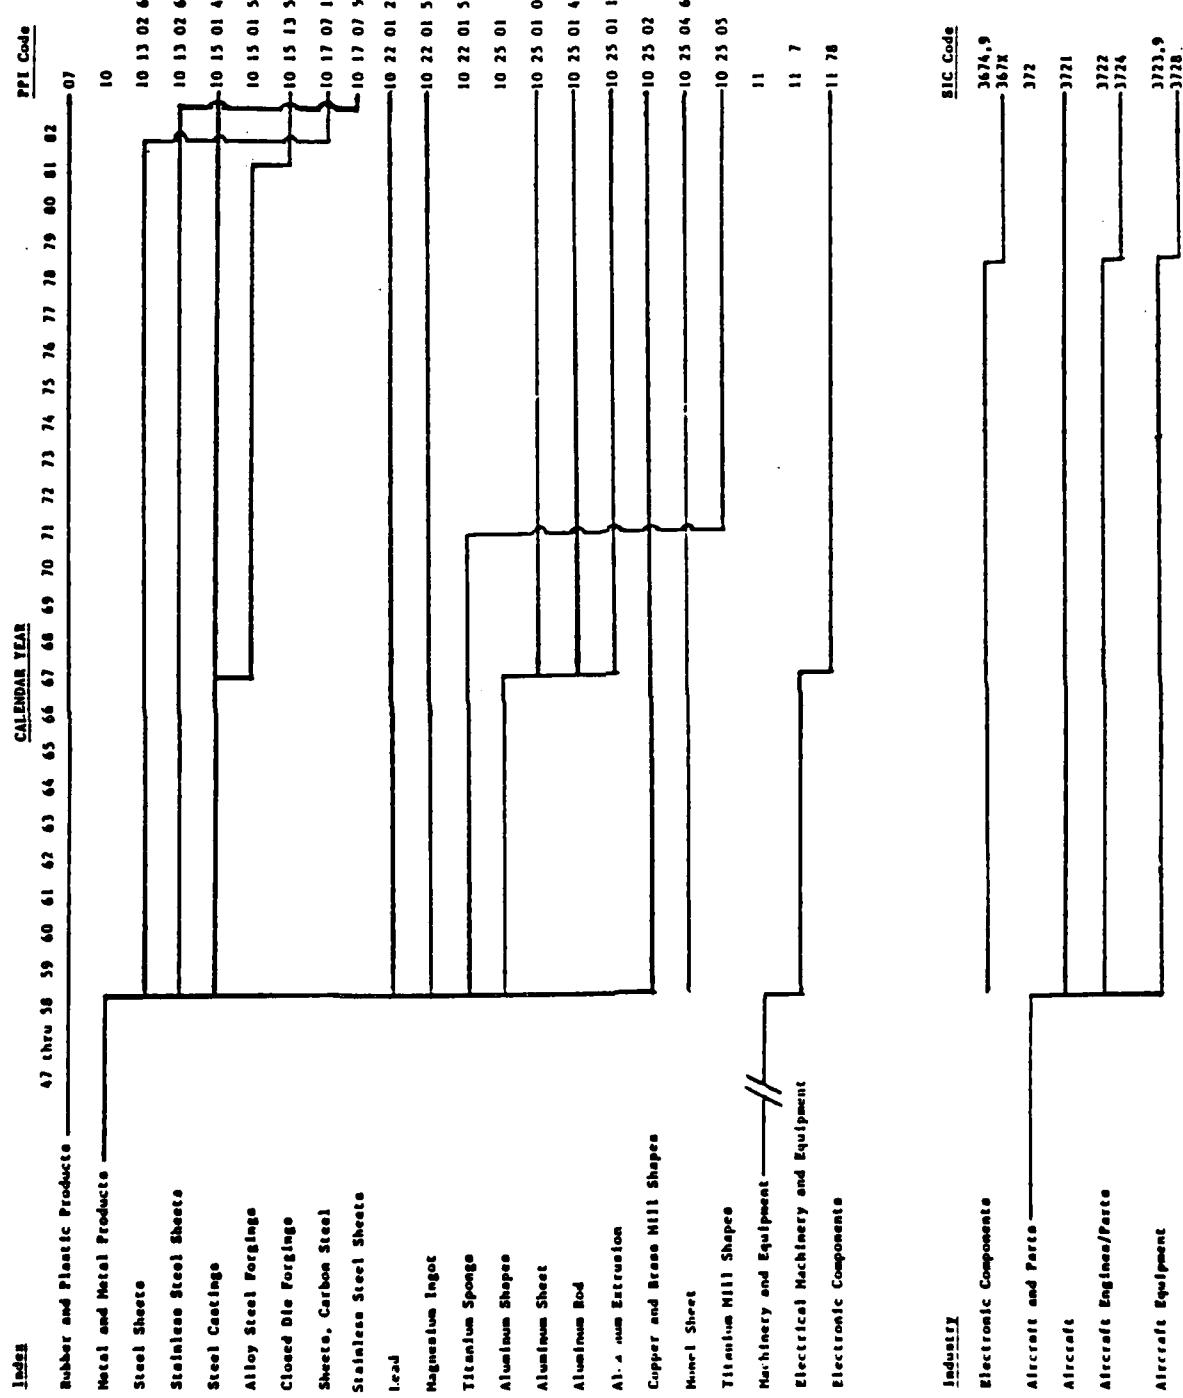

$$\begin{aligned}\text{HT-TECH Airframe} &= .0181(V-1) + .0019(V-2) + .0050(V-4) + .0006(V-6) + .0053(V-7) \\ &+ .0474(V-8) + .0120(V-9) + .0364(V-10) + .0126(V-11) + .0071(V-12) \\ &+ .0922(V-13) + .622(V-16) (100/3.49) + .1369(V-18) (100/3.35) \\ \text{HI-TECH Engine} &= .0014(V-1) + .1631(V-3) + .0038(V-5) + .0134(V-7) + .0051(V-8) \\ &+ .0016(V-9) + .0037(V-10) + .0016(V-11) + .2822(V-12) + .0525(V-13) \\ &+ .401(V-17) (100/3.42) + .0709(V-18) (100/3.35) \\ \text{HI-TECH Avionics} &= .3150(V-14) + .6850(100/2.34)(V-15)\end{aligned}$$

Variables (V-1) thru (V-18) are defined on pages B-2 thru B-4.

APPENDIX C

HISTORICAL FLOW OF PRODUCER PRICE INDEXES AND
EARNINGS SERIES USED IN HISTORICAL INFLATION
PROGRAM WITH REVISED WEIGHTING FACTORS

**Historical Flow of Producer Price Indexes
and Earnings Series Used in Historical
Inflation Program**
